WHY YOU SHOULD CONSIDER AN OUTSIDE SUMP PIT:

The common practice for the majority of basements built today, is to hook the outside perimeter tile drainage into an inside sump pit. Water entering the pit is then pumped back outside by the use of an electric sump pump. This is an effective and economical method for virtually all normal circumstances. However, when a power failure occurs (especially during a heavy rain), the electric sump pump is unable to pump the water back to the outside. This is where an outside sump pit is beneficial.

The outside perimeter tile drainage is hooked into the outside pit so no water is directly routed into the inside of the basement. Now, if a power failure were to occur, the water can rise inside of the outside sump pit, without any harm to the valuables in your basement. So if your looking for some added protection at minimal cost, consider an outside sump pit.
